Citations	17105	9582
h-index	60	48
i10-index	198	184

**h-index:** A scholar with an index of  $h$  has published  $h$  papers each of which has been cited in other papers at least  $h$  times. Thus, the  $h$ -index reflects both the number of publications and the number of citations per publication.

**i10-Index:** The number of publications with at least 10 citations.

Relative Citation Ratio (RCR)				Weighted RCR
MAX	MEAN	SEM	MED	
23.58	2.83	0.19	2.11	766.92

**Relative Citation Ratio (RCR):** A NIH metric representing a citation-based measure of scientific influence. It divides the actual citation count of a paper by an expected citation count, which provides an observed-over-expected ratio, presented as a decimal number.

An article with an RCR value equal to 1.0 is at the median for NIH R01-funded articles for that year. When the value is > 1, the article has received more citations than its peers for that year and subject area.

For instance, a paper with an RCR of 1.0 has received the same number of cites/year as the median NIH-funded paper in its field, while a paper with an RCR of 2.0 has received twice as many cites/year as the median NIH-funded paper in its field.

**Weighted RCR:** The sum of the RCRs for the articles within the analysis group. A highly influential set of articles will have a higher weighted RCR than total publications, while a set of articles with below-average influence will have a lower weighted RCR than total publications.
